

Agentic AI, from someone who has shipped it *at AWS and in the enterprise*

I'm Nick Buzzy. At AWS I was an engineering lead on the team that delivered Amazon Bedrock AgentCore, a founding engineer on SageMaker Canvas, and the lead of the 20-person team behind SageMaker Unified Studio's custom agents; the AI products whose launches I led there have grossed over \$100 million. Since leaving, I designed the AI system a Fortune 1000 retailer used to modernize 81 applications in under a year, and I've won and led multiple \$1M+ engagements. I also hold a JD and a finance degree and practiced law for seven years; risk, cost, and outcome are built into every design I hand over.

Buzzy Ventures takes on a limited number of engagements where expert AI guidance leads to real outcomes.

HOW I CAN HELP

No. 1

Agentic Architecture Assessment

An independent read on an agent architecture, an AI roadmap, or a vendor's proposal before money is committed: the delivery risks no one has priced in and a clear go, fix, or stop recommendation, with a safe-to-ship check on guardrails, sensitive data, and security. For investors, the same read on a target's AI claims, written for the investment committee.

No. 2

Agentic System Design

For a system, not a single workflow: the architecture, the agent orchestration, the verification gates that decide when AI-generated work counts, and the governance around it, delivered build-ready. This is the design behind 81 applications in under a year, every one generated by agents and gated before it shipped. Your team builds from it, with my oversight through the first wave where warranted.

No. 3

Applied AI, Proof of Concept to Production

One business problem, one model, a human in the loop, governance from day one. A scoped proof of concept with a measurable result in weeks, then a production phase. One example: an image-quality service that cut a retailer's vendor image review from weeks to seconds, now live in its supplier portal.

WHERE ENGAGEMENTS GO

Each engagement stands on its own: an assessment ends with a decision, a design with a build-ready plan, a proof of concept with a measured result. When a client wants more, fractional agentic-AI engineering leadership is available on a quarterly basis.

HOW IT STARTS

An intro call, then a fixed-scope proposal. No retainer to begin.

TRACK RECORD

- Engineering lead on the team that delivered Amazon Bedrock AgentCore; owned its console and helped shape its launch APIs
- Founding engineer on SageMaker Canvas; led 20+ engineers on SageMaker Unified Studio's generative-AI launch
- Designed the AI system that modernized 81 applications in under a year for a Fortune 1000 retailer; the prior decade managed 61
- Multiple \$1M+ engagements won and led; teams of 10 to 20+
- Three applied-AI systems in production: image quality, document intelligence, security and privacy automation
- JD and finance degree; seven years practicing law
